In this specification, the term "service" is used in a broad sense, and is intended to include one or more of the following: 1. communication services such as wireless local area networks (LANs), wireless personal area networks (PANs) and wireless local area network systems; 2. broadcast services; 3. multimedia services; 4. multicast services; 5. on-line services; 6. data services; 7. telephony services; and 8. entertainment services. The present invention relates generally to communications networks, and more particularly to a system and method for providing forward error correction coding in a communications network. As used herein, the term "coding" is used in the general sense of representing or mapping input data into an output data stream. In the context of communications, for example, coding may be used to provide for error correction, detection, and/or identification. When used in the context of communications, "coding" is intended to encompass any system of encoding and decoding data for error detection and/or
