The curve of Photoshop's evolution can be explained by its changes of direction. Beginning with the release of Photoshop 3, Adobe made a complete transition from being a publisher of raster graphics to being a provider of raster workflow. With this they provided the tools that are used by graphic designers to create raster graphics. This distinction was clearly broken with the release of Photoshop 5 when Adobe began providing the same tools for designing vector graphics as well. With the release of Photoshop 7 Adobe went back to raster work; they claimed that Photoshop's vector works is better than their other tools. They began to include the most common vector tools baked into Photoshop, such as the marquee tool, selection tools, and the outline tool. In Photoshop CS3, they started to include color tools as well. However, many users do not have the resources necessary to learn both Adobe Photoshop and Adobe Illustrator. In an effort to reduce their cost, Adobe decided to integrate the capabilities of both programs into one interface. This happens most notably in the additional features of the new Adobe Photoshop CS3 as well as the integration of the Adobe Illustrator vector assets back into Photoshop. There is one area where this complete integration doesn't work though. A definite improvement is the ability to send files to third-party services for automatic processing. As in Lightroom 4 and Adobe Bridge, or as in Photoshop Insider, you can now send files to Document Cloud for conversion, to Scan to Dropbox for scanning, or to Flickr for sharing. It's a most welcome addition that I tried out successfully over the weekend with both my new 1Dx and a Fujifilm X10r. Of course, I've been using the 1Dx this far, but the X10r is a new one for me.
