For those new to Photoshop, there's a nice introduction with a small tutorial called "Getting Started" (Adobe's term for the launch of the program). It goes over how to import photos, edit and recompose them, and apply basic adjustments. Even if you aren't sure about much of Photoshop yet, you'll find it a good place to start. Up top, in the onion skin, you will see tabs along the top. These are the features most people use. They include > Brush; > Selection; > Adjustments; the menu (for power settings and preferences); and Artboards. Now, select > Exposure Control to get to those. I've been using Adobe's Photoshop version numbers as a sort of shorthand reference to distinguish competing products, or to indicate a product's maturity. While this is still the case, I think Adobe has done a fantastic job of breaking its product categories so that it's easier to differentiate between them. The first 2 examples above are in "Basic" mode. If you want to start in "Power" mode and get access to "Radical" filters and other stuff, you need to use the purchase modifier, which is called "Photoshop Ultimate." Adobe provides a "Photos" tab on the top bar (if you don't see it, scroll up a little bit and it's there.) This is where you'll find most of the features. From there, you can also go straight into the "Adjustments" panel, where the Adjustment Brush, Gradation palette, and the Lens Correction filter are. (The Lens Correction filter, for those players who don't know, is kind of a one-shot automatic fix for a common problem with cameras and lenses, which is where the photographer's in-camera JPEG compression causes the image to look lighter in dimmer light. When you download the image, the product offers to fix it by analyzing the difference between the photo and a room light source.
