ZERO-G Hi-Hat Kaiji Vocaloid [TF] A: The title of VOCALOID that you've linked to is titled as, which is certainly made in Japan. When I searched for the word -"VOCALOID"- "AVANNA"-it's found to be made by Zero-G and A-ONE, which are Japanese Vocaloids. Source: The invention relates to feeding and conditioning of a beverage feed flow. Liquid beverages are typically prepared from a syrup, which may include appropriate additives, such as flavorings, colorings, preservatives and the like. The beverage mix is prepared by measuring a desired volume of water with a combination of ingredients, and delivering the combined water and beverage mix to the appropriate equipment for dispensing. Such equipment is well known to those skilled in the art, and any suitable equipment may be used for preparing a beverage. For example, a dispensing machine is typically provided with a receptacle for receiving a beverage mix. After mixing, the beverage mix is conveyed into the receptacle in preparation for dispensing. Many beverages, especially carbonated beverages, must be mixed and transferred while still at a very low temperature to minimize the growth of harmful microorganisms. To this end, many beverage dispensers have a cold plate or refrigeration unit that is set up to receive a predetermined volume of beverage mix at a very low temperature. Many systems include a refrigeration unit that is coupled with a dispensing machine. In such systems, the components of the machine and unit are configured to receive a beverage mix at very low temperatures. The refrigeration unit is coupled with the machine and creates a cooling environment that is maintained within the machine, or at least within a dispenser portion, to provide a low temperature condition suitable for dispensing of the beverage mix. In order to prepare a particular beverage, a volume of beverage mix is added to a receptacle of a dispenser. The mix is then pumped into the machine or dispenser, and the machine and system are operated to dispense the chilled beverage. In other systems, the chilled beverage is dispensed directly from the refrigeration unit into a receptacle. Some beverage dispensing systems or machines use a syphon system to flow the beverage mix through the machine. The syphon is a tube or the like that communicates between the refrigeration unit
